

**2002 HIGHER SCHOOL CERTIFICATE EXAMINATION**  
**Chemistry**

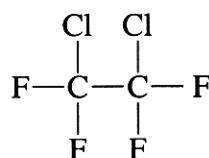

**Section I – Part B (continued)**

---

**Marks**

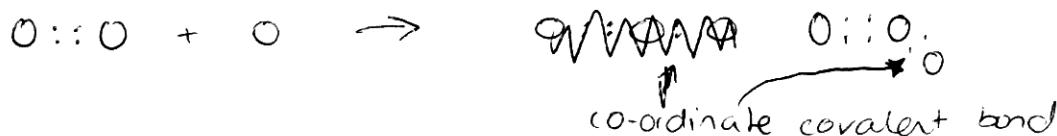

**Question 25 (6 marks)**

- (a) What is the systematic name of the CFC in the diagram? 1

.....1,2-dichloro-1,1,2,2-tetrafluoroethane.....

- (b) Identify the bonding within ozone, using a Lewis electron-dot diagram. 2

- (c) Discuss how CFCs damage the ozone layer, using relevant equations. 3

CFC's break down in the upper atmosphere to form free radicals that damage the ozone layer. These free radicals then react with  $\text{O}_3$ :  $\text{Cl} + \text{O}_3 \rightarrow \text{ClO} + \text{O}_2$ . The  $\text{ClO}$  atoms then react with  $\text{O}_3^{\text{atoms}}$ :  $\text{ClO} + \text{O}_3^{\text{atoms}} \rightarrow \text{Cl} + \text{O}_2$ . This then means the  $\text{Cl}$  free radical hasn't been used up and can now damage/break another  $\text{O}_3$  molecule. This chain reaction continues to occur until broken by other means. One  $\text{Cl}$  atom has the potential to break about 1000  $\text{O}_3$  molecules.
