

The biophysical interactions which lead to diverse ecosystems and their functioning which I have studied is the nepean river. The nepean river was almost polluted full of rubbish that the humans has thrown into, that had a huge impact on our environment. Our river is slowly starting to waste because of us throwing all our rubbish away and washing into our water ways.

rubbish is a huge issue dont need it but cant get rid of it we need a miricle. If everyone would just do the wright thing this wouldn't be an issue.

rubbish lets get rid of it.

Keep our world clean. put your rubbish in the bins.
