Part B – 60 marks

Attempt Questions 16–26

Allow about 1 hour and 45 minutes for this part

Answer the questions in the spaces provided.

Show all relevant working in questions involving calculations.

Marks

Question 16 (4 marks)

Muons are very short-lived particles that are created when energetic protons collide with each other. A beam of muons can be produced by very-high-energy particle accelerators.

The high-speed muons produced for an experiment by the Fermilab accelerator are measured to have a lifetime of 5.0 microseconds. When these muons are brought to rest, their lifetime is measured to be 2.2 microseconds.

- (a) Name the effect demonstrated by these observations of the lifetimes of the muons. **1**

.....
Short-life span

- (b) Calculate the velocity of the muons as they leave the accelerator. **3**

.....

$$v_x^2 = \gamma_x^2$$

.....

$$5.0^2 = 2.2^2 \gamma_x^2$$

.....

$$\gamma_x^2 = 2.27$$

$$= 1.51 \text{ microseconds / unit measured (dist)}$$

Question 17 (6 marks)

A rocket was launched vertically to probe the upper atmosphere. The vertical velocity of the rocket as a function of time is shown in the graph.

- (a) Using either words or calculations, compare the acceleration of the rocket at $t = 20$ s with its acceleration at $t = 100$ s. 2

The acceleration at $t=20$ and $t=100$ is the same number. It is constant because the curve in the first part of the graph does not change course.

- (b) Account for the shape of the graph over the range of time shown. 4

From $t=0$ to $t=120$, the velocity of the rocket is increasing ~~at a constant rate~~ which is shown in the parabolic form. But at $t=120$, the rocket is at its peak at 5 km/s, which is shown as a sharp corner. Then from $t=120$ to $t=240$, the velocity slowed down with a constant rate, which is shown as a straight line.
